About Us

Who would have thought, that the small bearings in a roller skate could change the way we look at efficiency on an industrial scale?

Our story began in 1998, when Jacob Csizmadia broke a world record by inline skating 505 kilometres in 24 hours, using skates equipped with ceramic ball bearings. Two years later, he introduced ceramic bearings to professional cycling at the Tour de France. After this success, CeramicSpeed was founded and started producing hybrid bearings in Holstebro, Denmark.

After years of scrupulous development and testing, CeramicSpeed bearings are second to none. Hand-built in Denmark with superior craftsmanship, our bearings provide customers with unmatched performance and bearing life resulting in lower operating costs, improved production uptime and increased competitiveness.

From small electrical equipment to offshore wind turbines, we have revolutionised efficiency on an industrial scale, providing technological advantages for a diverse range of applications. We work with global manufacturing companies across an array of sectors to achieve operational savings that allow them to remain competitive and continue to grow. In 2014, CeramicSpeed received an FDA certification with approval for direct contact with food products and in 2021 we became ISO 9001 certified.

A winning mentality is how it all started, and it's this guiding principle that continues to drive us forward.

CeramicSpeed Balls

Ceramic balls can be found in a variety of materials. The best material available - and the one used for our bearings - is silicon nitride (Si_3N_4)

Silicon nitride balls are less dense and much lighter (58 %) than steel balls. This means that the energy requirements for running the machinery will drop - but the main advantage of the low weight is found in a longer bearing life.

The low weight reduces the centrifugal load on the raceway as the bearing spins, and wear and tear are significantly reduced, keeping the bearing in top condition for longer. As an added benefit the bearing can operate at much higher RPMs - up to 50 % higher - giving you the possibility of using long-life bearings in demanding high-speed applications, such as machine tool spindles and turbo machinery.

One of the main advantages of ceramic balls over steel ones is their low friction coefficient - this reduces the need for lubrication quite significantly.

Less Lubrication

Without lubrication, any bearing will break down quickly. Direct contact between steel ball and steel raceway will lead the bearing to fail rapidly. Steel against steel has a friction coefficient of 0.8, whereas steel against ceramic has a coefficient of 0.2 - or even lower, if the races are coated. As a result, ceramic balls eliminate the problem of two identical materials breaking each other down.

The hardness and finish quality of the ceramic balls also serves to polish out any damage to the races, whereas this would lead to further breakdown and failure in steel bearings.

	Steel Balls	Silicon Nitride CeramicSpeed Balls	Difference
Density [g/cm ³]	7.6	3.2	58% lighter
Hardness (Vickers)	700	1600	128% harder
Elastic modulus [GPa]	190	310	63% stiffer
Thermal expansion coefficient [μm]	12.3	3.7	-70%
Max usage temperature [°C]	320	1000	+680
Surface finish grade [micron]	0.02	0.005	400% smoother
Life wear resistance	-	<10x	<10x
Electrical resistivity [Ohm/cm]	10^{-9}	10^{14}	10^{16} =insulator 0=superconductor

Unique Properties

The smoothness and hardness of the CeramicSpeed Balls are unique. After 600 hours of testing, the CeramicSpeed Ball is still in perfect condition whereas the surface of the other ceramic balls is rough and bumpy after only 10 hours of testing. A rough ball creates increased friction in the bearing and quickly wears down the steel races.

This picture below shows two ¼" (6.35 mm) balls. The one to the left is a CeramicSpeed Ball and the one to the right is a standard steel ball. We applied the same pressure to both balls and the result is clear; the steel ball simply cracked under the load, while the CeramicSpeed Ball is 100% intact and perfectly usable.

Surface Technologies

Bearing rollers, races and other wear parts can be coated to increase resistance against wear and prolong the service life.

The industry's demand for extremely varied technical surface technologies has over the last couple of years been increasing. The overall performance and reliability of machines, units and equipment is becoming more and more important which has led to development of a variety of processes and new materials within surface treatment.

Many advantages can be achieved by coating the material surface of e.g. rolling bearings and linear components, however many coating processes are not suitable for situations in which rolling or compressive stress occurs - but our coating system is created for this.

Our coating system protects the surface from outside environmental conditions and increases the durability of bearing rollers, races or other wear parts' durability. This type of coating also results in extremely good rolling capacity especially if it's used on rolling bearings which results in a supreme protection against wear and corrosion.

CeramicSpeed Coating protect the surface but the technical improvement involved in this process also leads to energy savings and an efficient use of material. Any steel suitable for rolling bearings may be used as the basic material to be coated e.g. 100Cr6 (1.3505) steel. But the coating is also very beneficial if you use AISI 440C (1.4125) corrosion resistant steel or AISI50 (1.3551).

	Bearing Steel (Reference)	CorroCoat	HardCoat	Black Oxide
Process		Dipping	Physical Vapor Deposition (PVD)	Dripping
Process temperature		<80	170	140
Color		Grey	Black	Black
Hardness, HV (vickers)	700	1200-1300 *	1200-1800 *	700
Max. running temperature °C	150/200	800	500	200
Thickness µm	Solid	3-6 µm	< 3µm	< 1µm
Coefficient of friction (against steel)	0,8	0,25	0,05-0,1	0,7

* Depending on specimen material properties

HardCoat

This coating is within the family of DLC coatings, ideal solution for demanding applications where bearing components are under high loads or subject to extreme friction and wear. The high hardness and low coefficient of friction can prevent rolling elements from pitting, seizing and ultimately failing during operation.

Corrocoat

Our CorroCoat system consist of 98% pure chrome. A chromium coating has many advantages and it can be desposited by a high-energy process for any steel that is suitable for coating. The hardness of this coating system is between 75 and 78 HRC (1300-1560 HV).

Black Oxide

Black Oxide treatment is an old technology often associated with initial wear protection or run-in protection. Recent studies have showed that black oxidizing also has a positive effect on bearing steels in regards of hydrogen embrittlement and white etching crack building in bearing steel. As oxidizing is a simple and inexpensive process, this offers a straight forward solution improving safety margins for many bearing applications .

Product Series

CeramicSpeed Insulate

The obvious choice for modern electrical motors

CeramicSpeed Insulate ball bearings are custom made for electrical motors and your guarantee against damage caused by stray currents. The ceramic balls used for CeramicSpeed Insulate series are non-conductive and have an insulating ability of 15 kV per mm - higher than that of atmospheric air.

Lower Energy Consumption

Compared bearing to bearing, we have documented 48% lower friction in our own CeramicSpeed Hybrid Bearing compared to similar sized premium brand steel bearings. In an electrical motor, this reduction in bearing friction yield a measurable increase in overall motor efficiency and resultantly a reduction in energy need and a reduction of CO2 emmissions.

Non-conductive balls

Bearings from competing manufacturers with an insulating coating typically have an insulating ability of up to 1 kV; provided that the coating is not damaged - for example when the bearing is mounted. In practice this protection isn't always sufficient, meaning that these bearings are also vulnerable to damage by stray currents. The ceramic balls used for this product series are non-conductive and have an insulating ability of 15 kV per mm - higher than that of atmospheric air.

In addition to being protected from the passage of electrical currents, the operating temperature is 10-20 °C lower, and the result is a bearing life typically 4-8 times longer than traditional steel bearings.

Advantages of CeramicSpeed Insulate

- Lower energy consumption
- 4-8 times longer lifetime
- Your guarantee against bearing current
- Fast ROI
- Lower operating temperature - 10-20 °C lower than steel bearings
- Higher RPM - up to 50 % higher than steel bearings

CeramicSpeed Corrotec

FDA/EN-1935 approved bearings for the food and beverage industry

In the food and beverage industry, uptime and reliability are everything. Production equipment requires food-grade certification, and any breakdown will cause costly production stops. The bearings used must be of the highest possible quality and must be able to withstand high temperature fluctuations, humid and contaminated working conditions with the longest bearing life possible.

CeramicSpeed Corrotec ball bearings are FDA approved and suitable for use in the food industry. The bearings are manufactured using stainless steel rings with ceramic balls and lubricants approved for use in the food industry.

Bearings with lubricant approved for the food industry

When talking about food-approved lubricants, bearings usually require constant lubrication during the production process. As an alternative, sealed bearings can be used. These are delivered with FDA approved lubricants which will last throughout the bearing's lifetime.

We have launched a complete bearing program certified as FDA compliant, these bearings are approved for use in the food industry and certified for direct contact with food.

Advantages of CeramicSpeed Corrotec

- FDA/EN-1935 approved
- 4-8 times longer lifetime than conventional bearings
- Corrosion resistant

CERAMIC SPEED

NUZZA-K. HØRST C3 DENMARK Q11

CeramicSpeed Xtreme

A highly resistant bearing that is unlikely to fail even in the most contaminated environments

Imagine a ball bearing in which the balls are harder and tougher than anything that comes into contact with them: dust, grit, metal filings, tiny mineral fragments. Imagine a bearing in which all contaminants are ground to microscopic powder by the balls themselves - a bearing that is unlikely to fail.

Crushing the Particles

Our Xtreme series is designed for applications in contaminated environments, where particles can penetrate the bearing and affect the bearing performance. Characterized by unmatched hardness, the hybrid balls tolerate a high degree of contamination, crushing the particles that penetrate into the bearing races. They are also highly resistant against water and detergents because Silicon Nitride does not corrode.

The CeramicSpeed Xtreme series can also be manufactured and optimized specifically for oscillating applications. These applications match special machines, where a bearing not performing full rotation is needed.

Angular Contact Ball Bearing

In pumps, compressors and generic motor installations running vertical shafts the angular contact ball bearing is often a solid mechanical solution. These however – just like DGBB's – suffer from more and more frequent exposure to electrical stray currents - bearing currents. We can remove this problem with the high quality insulating ceramic balls in our Insulate deep groove ball bearing product series, and we now offer the same guaranteed solution for angular contact ball bearings with a maintained stock of standard executions.

Advantages of CeramicSpeed Xtreme

- 4-8 times longer lifetime than conventional bearings
- Extreme resistance to contamination, heat and dust
- Lower friction and operating temperature
- High temperature versions available on request
- Guarantee against bearing current damages
- High speed rating

CeramicSpeed SLT

At CeramicSpeed we do not accept ultra-short bearing life - not even under the most severe conditions.

One of the solutions to bearing failure we have developed in house is our CeramicSpeed SLT. CeramicSpeed Solid Lubrication Technology is a polymer matrix saturated with lubrication oil. The matrix ensures that the oil is kept on the functional surfaces of the bearing even under very harsh conditions while at the same time preventing moisture and foreign particles from entering the bearing.

CeramicSpeed SLT is food-grade approved and can be combined with most sealed bearing types. In combination with stainless rings and our high-grade ceramic balls, it ends up being an extremely durable and maintenance-free solution for demanding applications in many industries.

Technical Specifications	
Base oil viscosity at 40°C (105F)	220 cSt
NSF H1 Food Grade	Yes
MOH/MOSH/MOAH free	Yes
Operating temperature (°C/F)	
Maximum continuous	85°C / 185F
Minimum start-up temperatures	-25°C / -15F
Maximum intermittent	95°C / 205F
Relubrication Free	Yes
Recommended maximum speed	40.000/dm where dm= 0,5 (d+D) mm

Focus Application

- Environments with severe particle contamination.
- Applications in moist surroundings - even under splash water influence.
- Chemical, pharmaceutical or other applications, where no liquid lubricant can be allowed.

CeramicSpeed SlipCoat

When clean running is required. We have received the question more than once – and in recent times more and more often: Can you make a bearing run without lubrication?

So far, our answer has been the same “All bearings can run without lubricant - but not for very long time”. The underlying demand has however triggered our imagination. How to provide a solution for applications where any tiny drop of oil could ruin products, processes, or sensitive environments?

So, when one of our good customers gave us the exact challenge of making a “lubrication free” bearing where no dripping or splatter of lubricant was acceptable and with a run time of more than 3.000 hours of operation, we gave the challenge to our in-house specialists. It took them 3 iterations to achieve a solution capable of meeting the specified target.

Solution tested:

Ball bearing size 6202

- Stainless steel rings (AISI440C)
- Silicon Nitride rolling elements
- CeramicSpeed SlipCoat treatment

Limitations

As the coating remains soft it creates some friction in the bearing. Hence the solution is not recommendable where low friction / high speed is a key performance focus.

Technical Highlights

- Coating material is FDA and EN1935 compatible
- Functional in temperatures from -20 until 260 C
- Extremely chemically inert
- Transparent / colorless

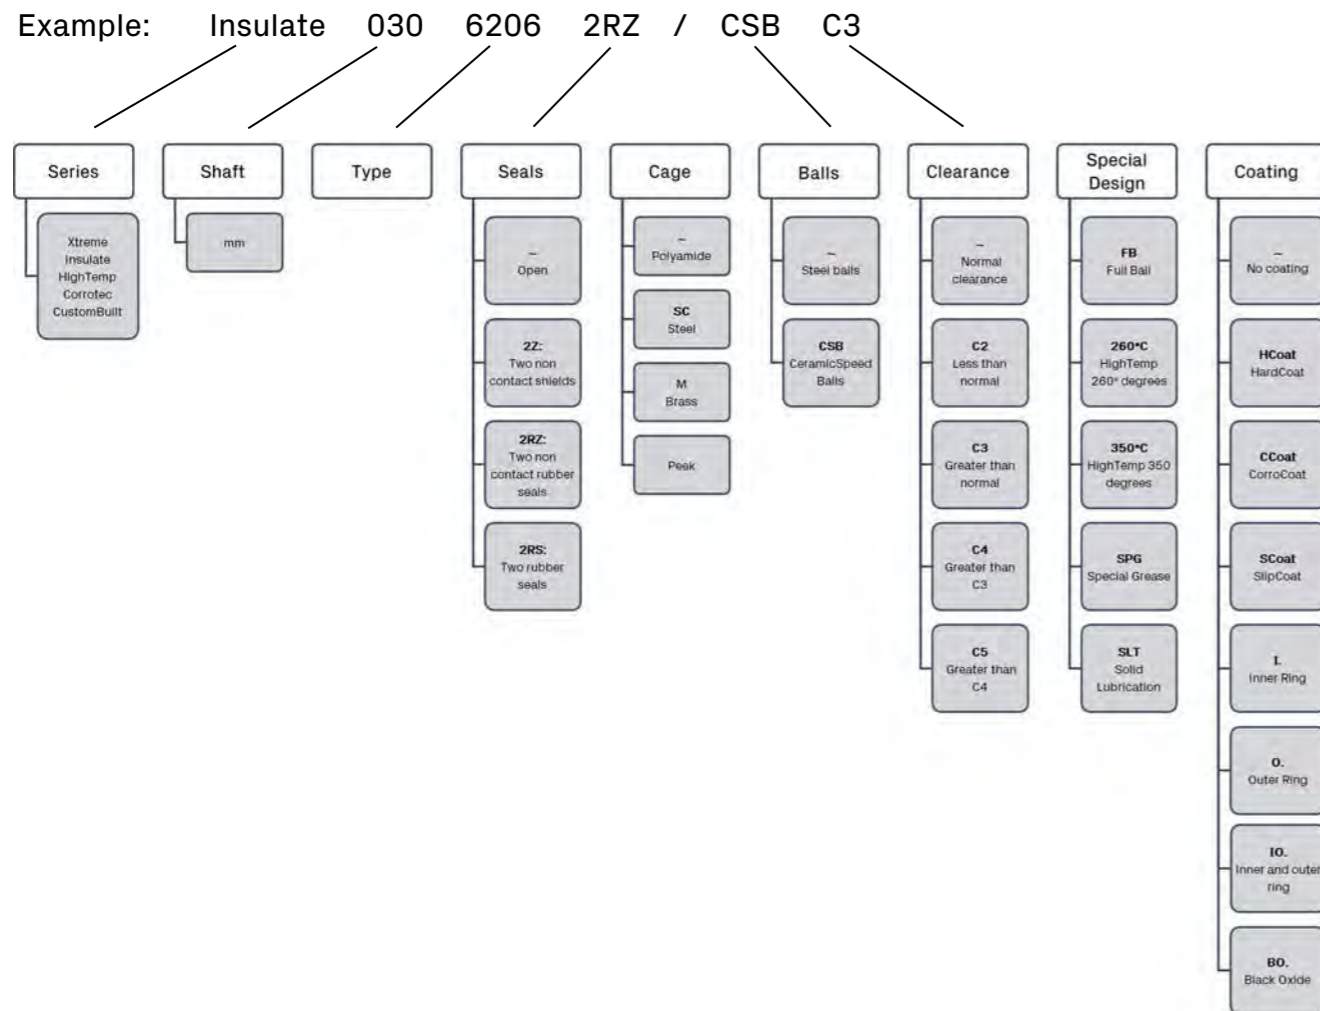

Technical Data

Designation System

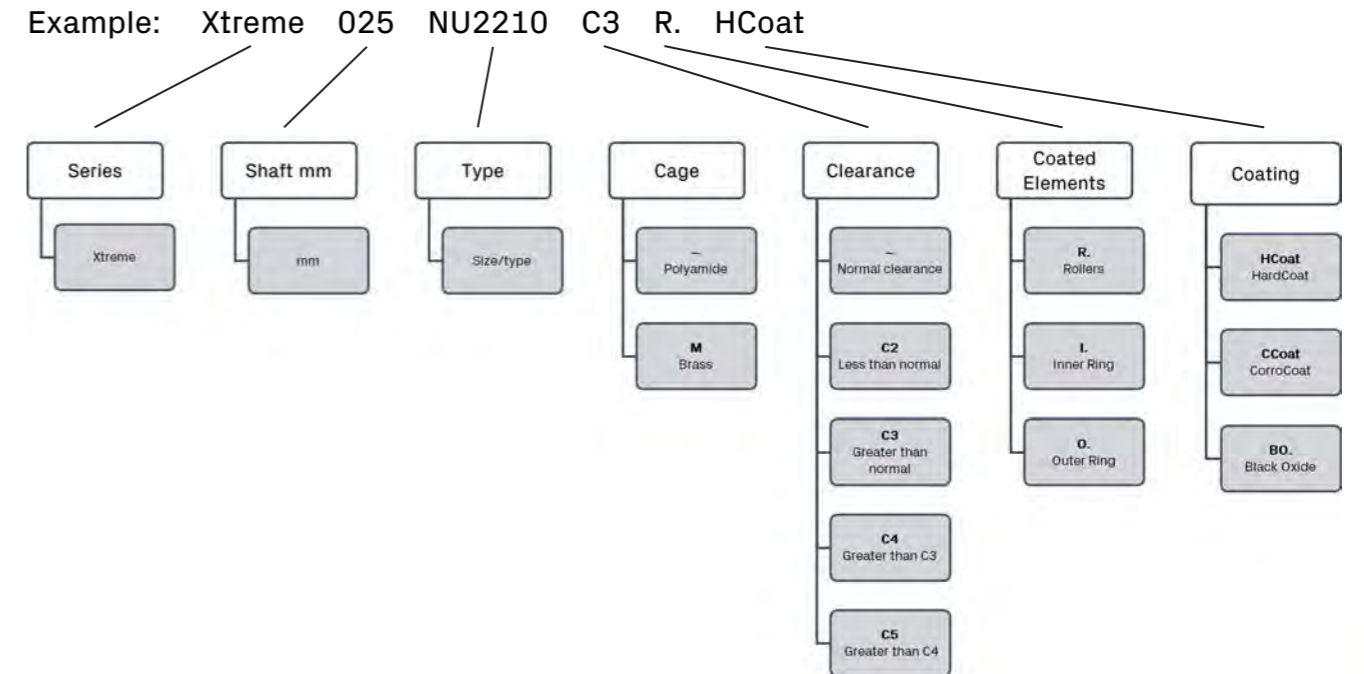

Ball Bearings

The CeramicSpeed Bearings can be used as means of optimisation within a wide range of issues. Amongst other things, these can be applied in areas with contamination from water, dust, dirt and metal, whether it is about bearings with many starts/stops, or where there is a need for fast acceleration. In harsh environments with insufficient lubrication, high temperature, vibrations, bearing stray current and other forces as such, you will find that CeramicSpeed Bearings have a much longer service life and thus a better overall economy.

Coated Roller Bearings

The CeramicSpeed Roller Bearings are ideal for solving issues with bearings that do not run optimally in contaminated environments such as water, dust, dirt, metal, etc. In these environments, the CeramicSpeed Roller Bearings have a much longer service life. The same applies for the environments, where conditions are problematic; this can be everything from frequent starts/stops to high temperatures or lack of lubrication. Our CeramicSpeed Coated Roller Bearings ensure a better overall economy because of their unique properties.

Bearing Lubrication

The lubricant is a vital part of every ball and roller bearing's optimal function. The correct lubricant, in the right volume, is essential for the bearing noise, temperature and service life.

What does the lubrication grease contain?

Base oil: Mineral or synthetic oils, which is the actual lubricant in the grease.

Soap/thickener: A fastening factor, which ensures that the oil remains in the bearing.

Additives: Added to the oil to optimise the properties.

Important parameters when choosing the optimal lubricant

Temperature range

The selected lubricant should be able to operate within the same temperature range, as the bearing is intended to run at. Exceeding the lubricant's temperature limits will shorten its service life dramatically. The service life is reduced to half, at only 15 °C above the limit.

Base oil viscosity

Generally, high load and low rotational speed require a high base oil viscosity.

Contrariwise, low load and high rotation speed require a lubricant with low base oil viscosity.

Typical choice of viscosity:

- Spindle bearings > 10.000 RPM/min.: 20 – 40 [cSt] v/40°C
- Electrical motors < 3.000 RPM/min.: 80 - 120 [cSt] v/40°C
- Main bearing in a windmill rotor < 20 RPM/min.: 200 – 400 [cSt] v/40°C

Other significant input

- Requirements for use in the food industry (FDA/EN-1935)
- Noise requirements
- Protection against corrosion

Lubrication interval

The optimal lubrication interval is 0.5 – 0.7 times the theoretical lubricant service life, which can be difficult to calculate, but it can often be found in the charts and technical documentation of the lubricant supplier. A representative lubricant can for example have a service life of up to 80,000 hours at 70°C but only 15,000 hours at 100°C.

Lubrication volume

The recommended lubrication quantity can be found by simply applying the following formula: $D \times B \times X = M[\text{cm}^3]$

- D = the bearing's outer diameter in mm
- B = the bearing's width in mm
- X = 0.002 (weekly lubrication) / 0.003 (monthly lubrication) / 0.004 (annual lubrication)

Miscibility Matrix

Miscibility is always associated with the risk of mixing different types of lubricant.

Miscibility of base oils

If necessary, the risk can be reduced by examining whether the lubricant's main components (oil and soap/thickener) can be mixed according to the table below.

	Mineral Oil	Synthetic Hydrocarbon	Ester Oil	Polyglycol	Silicone oil (Methyl)	Perfluoroalkyl Ether	Silicone Oil (Phenyl)	Polyphenyl Ether Oil
Mineral Oil	+	+	+	-	-	-	+/-	+
Synthetic Hydrocarbon	+	+	+	-	-	-	-	+

Bearing Steels

CeramicSpeed standard steel rings

High carbon chrome 100Cr6/ASTM52100 with Ovako steel quality purity Q or better.

	C%	Si%	Mn%	P%	S%	Cr%	Ni%	Mo%	Cu%
Min	0.93	0.15	0.25			1.35			
Max	1.00	0.35	0.45	0.025	0.025	1.60	0.25	0.10	0.30

Specification	Macro Inclusion mm/dm ²	Oxygen Content (ppm)			Titanium Content (ppm)	Micro Inclusions							
						A		B		C		D	
						Th	He	Th	He	Th	He	Th	He
		C* < .5% 0.5 < C < .8 C* > .8%				Th	He	Th	He	Th	He	Th	He
CQ	According to customer requirements												
Q	5	15	15	15	-	2.5	1.5	1.0	0.5	0	0	0.5	0.5
BQ	2.5	11	9	7	30	2.0	1.5	0.5	0.1	0	0	0.2	0.1
PBQ	1	9	8	7	30	1.0	0.5	0.5	0	0	0	0.2	0

CeramicSpeed stainless rings

CeramicSpeed use race made of martensitic stainless steel like SUS440C (X102CrMo17) or KS440 (X65Cr13)

Material	Stainless steel		
Symbol	SUS440C	KS440 (ACD34)	
Chemical Composition %	C	0.95 ~ 1.20	0.60 ~ 0.75
	Si	< 1.00	< 1.00
	Mn	< 1.00	< 1.00
	P	< 0.040	< 0.030
	S	< 0.030	< 0.020
	Cr	16.00 ~ 18.00	11.50 ~ 13.00
	Mo	< 0.75	< 0.30
Equivalent	AISI440C, X102CrMo17	X65Cr13	

Seals

CeramicSpeed offers three options of seals integrates in deep groove ball bearings.

Seals Type RZ (2RZ)

A non-friction rubber seal, which grants optimal protection for the bearing, also at higher speed, without creating undue friction.

Seals Type RS (2RS)

A friction rubber seal, which provides optimal protection for the bearing, but limits the potential rotational speed and creates friction.

Shield Type Z (2Z)

Shields that provides a fundamental protection of the bearing without creating friction and without limiting the bearings' potential rotational speed.

Seal Type	Protection	Friction	High Speed	Temperature (max)
RZ	++	++	+++	120°C
RS	+++	-	-	120°C
Z	-	+++	+++	360 °C

(+) Suitable (-) Less suitable

Ball Cages and Roller Cages

The purpose of the ball cages or roller cages' is to keep the distance between the rolling elements of the bearing, and thus to reduce friction.

CeramicSpeed produces bearings with ball and roller cages in the following materials:

Cage Material	Fatigue Strength	Friction	Chemical Constancy	Temperature (max)
Steel	++	+	+	360°C
Brass	++	+	++	250°C
PA66	+++	++	+	120°C
PEEK	++	+++	+++	200°C

Steel:
Typically pressed into the plate and assembled with rivets or screws.

Brass:
Machined and assembled with rivets or screws.

PA66:
Glass fiber reinforced Polyamide. Injection molded in one piece.

PEEK:
Polyether-ether-ketone. Injection molded in one piece.

Handling & Bearing Installation

CeramicSpeed Bearings have to be mounted with the same careful consideration as standard steel bearings. Below you can see how you should mount our bearings and what you should be careful with during the mounting.

Do's

- Always use the correct tools; impact sleeve or bearing heater
- Remember to keep the bearing and its surroundings clean during assembly

Don'ts

- Never knock the bearing directly with a hammer or hard objects
- Do not apply mounting power through the bearing's balls/rollers
- Never leave a new bearing uncovered for a longer time.

Quality Control

Our products are assembled by hand in our production facility in Denmark and every single bearing is individually checked throughout the assembly process.

Incoming goods inspection

All components are checked geometrically and visually and we perform random checks via vibration analysis on finished components.

Mounting

At CeramicSpeed, the final assembly is always done by hand, and our staff checks the finished products both visually and auditory after each step of the process.

Certified after ISO 9001:2015

Quality has always been on our mind and we strive every day to supply what we promise and when we promise. This doesn't change or improve with a certificate alone, but we strongly believe in ever increasing efficiency and with the ISO system implemented, we have even more tools in the toolbox to support our aims.

The ISO 9001:2015 certification is internationally recognized as the world's leading quality management standard and has been implemented by over one million organizations in over 170 countries globally. The purpose of the standard is to assist companies in meeting statutory and regulatory requirements relating to their product while achieving excellence in their customer service and delivery.
